B

CORPORATE-STRUCTURE

GOEMON GLOBAL FINANCE · CONFIDENTIAL — FOUNDER · **JUNE 29, 2026**

Strategic guidance only — not legal, financial, tax, or investment advice. Securities, money-transmission, and corporate-formation decisions must be reviewed by licensed counsel and a CPA before you act. Sections flagged "⚖ see counsel" are where this matters most.

Contents

Corporate Structure & Compliance Strategy

A lean-now, licensed-later blueprint for incorporating Goemon Global Finance as a US tokenization-first fintech — the least-compliance entry that still scales cleanly into a fully licensed money business.

> **How to read this.** Every section is tagged **DO NOW**, **DEFER → Phase B/C**, or ⚖ **see counsel**. Dollar and time figures are planning estimates (2025–2026 US), not quotes. This is strategy, not legal advice — the regulated decisions must be run past a fintech attorney and a CPA before you file or launch.

---

1 1. Executive summary & the core legal thesis

The thesis: the cheapest legal way into fintech is to *not be a money business yet*. Goemon Global Finance's locked architecture already supports this — keys live in the user's Secure Enclave, the server never holds a private key, and tokenization is delivered as **software**. If you never take custody of customer funds and never act as the intermediary that moves value, you stay outside the two most expensive US regimes (money-transmitter licensing and broker-dealer registration) for as long as possible.

So the strategy is a **three-phase compliance ramp**, with the corporate structure built on day one to absorb each phase without re-papering the company:

Phase	What you are	Licensing burden	Trigger to advance
A — Launch	Software + non-custodial wallet + tokenization infrastructure	Minimal: entity, AML *policy*, terms, IP. **No MTL.**	Live product, first users
B — Partnered	Same, plus regulated **partners** (BaaS bank, custodian, transfer agent, KYC vendor) move the money/assets for you	FinCEN MSB registration likely; partner due-diligence	You need fiat in/out or pooled custody
C — Licensed	You hold your own licenses / charter	State MTLs (or bank partnership), transfer-agent registration, possibly broker-dealer/ATS	Scale, unit economics justify owning the rails

The single most important rule: the moment you touch customer fiat or hold their crypto for them, you are probably a money transmitter in most states. Phase A is engineered to never do that.

Recommendation at a glance:

- **Form a Wyoming LLC now** (`Goemon Global Finance, LLC`) — the lowest-cost, lowest-admin, most private US entity, with pass-through taxation and crypto-friendly statutes. **Convert to a Delaware C-corp later**, when you raise institutional capital or stand up the regulated subsidiary (Phase B/C).
- **The agreed ownership is two founding members: Chad Cromwell — 51%** (Manager + CEO) and **Oran Cromwell — 40%** (father/son), with a **9% incentive pool** reserved for future team/advisors. The LLC is **manager-managed** (Chad) and taxed as a **partnership** (Form 1065; a K-1 to each member). This is the design the executed founding docs in `docs/legal/` (Operating Agreement, Initial Resolutions, Equity Incentive Plan, Articles/BOI) implement — see §4.
- **Adopt a real operating agreement** — it's the document partner banks, vendors, and a future conversion all lean on, and it's where the 51/40/9 split and Chad-as-manager control are recorded (the public Articles do not state ownership).
- **Assign the IP** (the code already in this repo) from you personally to the company immediately — the single cheapest-now / expensive-later action in this plan.
- **Do not market the product as a "bank"** or "banking." That word is regulated; using it can draw a cease-and-desist before you have a single user. (Yes, this affects the product name — see §9.)

---

2 2. Entity structure — start as a lean Wyoming LLC, convert into a holdco

2.1 What to form now (DO NOW)

A **two-member Wyoming LLC**, `Goemon Global Finance, LLC` — **Chad Cromwell (51%, Manager + CEO)** and **Oran Cromwell (40%)**, plus a **9% incentive pool** reserved for future team/advisors — **manager-managed** by Chad. It is the cheapest, most private US entity for a lean start, and a multi-member LLC keeps a clean co-founder structure without the cost and double-taxation of a C-corp. A multi-member LLC is taxed as a **partnership for federal tax** (Form 1065; a Schedule K-1 to each member) — still **pass-through** (no entity-level corporate tax), just filed at the entity level rather than on a single personal return.

Why the Wyoming LLC for a lean start:

- **Minimal cost & admin.** ~$100–150 to form, ~$60/yr to maintain, no state income tax.
- **Pass-through taxation.** No double tax; income and (subject to rules) losses flow through to the members' returns via K-1. A partnership return (1065) is more than a solo Schedule C but far lighter than a C-corp.
- **Privacy.** Wyoming doesn't publicly list LLC members — ownership lives in the operating agreement, not the public Articles.
- **Crypto-forward law.** Wyoming pioneered digital-asset statutes, the DAO LLC, and the SPDI charter.
- **Liability shield** for the members' personal assets — as long as you respect the formalities (separate bank account, operating agreement, no commingling).

The honest tradeoffs vs. a C-corp — and why they don't bite yet:

- **No QSBS.** The §1202 gain exclusion needs a C-corp. You forgo it *until you convert* — acceptable while pre-revenue and pre-raise.
- **Equity comp uses profits interests.** As a multi-member LLC you grant team/advisors **profits interests** (a share of *future* upside above a hurdle) from the 9% pool rather than clean ISOs/NSOs — tax-efficient if papered correctly (Rev. Procs. 93-27 / 2001-43), and it converts to a normal option pool at the C-corp step.
- **Investors require conversion.** Institutional money wants a Delaware C-corp; **LLC → C-corp conversion** later is a real, lawyer-assisted step (often structured tax-neutrally) costing ~$3–8k, at which point the members' units become founder stock and profits interests become the option pool.

So: the WY LLC is the right lean Phase-A vehicle. Treat the **conversion to a Delaware C-corp** as a planned future event tied to your first institutional raise or your first regulated subsidiary — not something to pay for now.

2.2 Where this is going (DEFER → Phase B/C): convert, then split into a holdco

When you raise capital or introduce regulated activity, **convert the LLC to a Delaware C-corp** (statutory conversion, or an F-reorg/Up-C as counsel advises) and adopt a holdco + opco structure so a license never contaminates your software IP:

```
                 ┌─────────────────────────────┐
                 │   Goemon Global Finance, Inc. (Delaware)│  ← parent holdco; owns IP
                 └──────────────┬──────────────┘
                                │
            ┌───────────────────┼────────────────────┐
            ▼                   ▼                    ▼
  ┌──────────────────┐ ┌──────────────────┐ ┌─────────────────────────┐
  │ Goemon Tech      │ │ Goemon Markets   │ │ Goemon Transfer/MT   │
  │ (software/IP)    │ │ (RWA issuance,   │ │ (regulated sub:      │
  │ non-custodial    │ │  Reg D/A+/CF)    │ │  MTLs / transfer     │
  │ software/IP home│ │  — Phase B       │ │  agent — Phase C)    │
  └──────────────────┘ └──────────────────┘ └─────────────────────────┘
```

*(Until you convert, "Goemon Global Finance, LLC" simply **is** the software/IP entity — the boxes below collapse into the single LLC. The split appears only at conversion.)*

The reason: licenses, bonds, regulatory exams, and money-movement liability sit in the regulated subsidiary. If that entity ever has a problem, your core technology and IP — the valuable asset — are insulated in a separate box owned by the parent. You **don't pay for this complexity until the revenue or the regulator forces it.** ⚖ see counsel when you spin up the first subsidiary.

2.3 The alternative (if you'd rather optimize for fundability now)

If raising institutional money or pursuing licensing *soon* is likely, you can **skip straight to a Delaware C-corp** and avoid a later conversion — at the cost of higher run-rate, double taxation, and more admin than a bootstrapper needs in Phase A. For Goemon Global Finance's lean, pre-revenue start, the **Wyoming LLC is the recommended default**, converting when the money or the regulator makes the C-corp worth it.

	Wyoming LLC *(recommended now)*	Delaware C-corp	Offshore token entity
Setup cost	~$100–500	~$500–1,500 (DIY–lawyer)	$$$ + ongoing
Annual cost	~$60–150	~$400–900	high
Taxation	Pass-through (simplest)	Double (corp + dividends)	Complex (CFC/PFIC)
Stock/options	Units / profits interests	Native, clean	n/a
QSBS	❌ (gained on conversion)	✅	❌
Fundraising-ready	Convert first	✅ best	Complicates US raise
Regulator/bank credibility	Good	✅ high	Scrutiny / de-risking
Best for	**Your lean Phase-A start**	Imminent raise/licensing	Not recommended US-first

---

3 3. Where to incorporate

Wyoming for the LLC now. Delaware when you convert. Wyoming again on the radar for a future charter.

- **Wyoming (now)** — the LLC home: no state income tax, member privacy, low fees, and the most crypto-forward statutes in the US (digital-asset law, the **DAO LLC**, and the **Special Purpose Depository Institution (SPDI)** charter — a long-term option for a crypto-native, custody-capable "bank-like" entity without FDIC deposit-taking). You'll **foreign-qualify** in your home state (where you actually work) and pay that state's fees too — budget for both. If you live in a high-tax/high-fee state (e.g., CA), confirm whether you must *also* register the LLC there. ⚖
- **Delaware (on conversion)** — when you raise or issue equity, convert to a **Delaware C-corp**: predictable corporate law (Court of Chancery), a playbook every investor/bank/lawyer knows, and clean stock mechanics. This is the planned Phase-B/C move, not a day-one cost.
- **Offshore (Cayman/BVI/CH/UAE)** — common for token *issuance* in pure-crypto projects, but for a **US-first, US-user** product it adds tax complexity (CFC/PFIC rules), banking

friction, and regulator suspicion. **Not recommended** for your launch. Revisit only if a token-generation event for a protocol token (not the product) is ever on the table. ⚖ see counsel.

Decision: form `Goemon Global Finance, LLC` in Wyoming now; foreign-qualify where you live; plan the **Delaware C-corp conversion** for your first raise/regulated subsidiary; keep the **Wyoming SPDI** as the deep Phase-C charter option.

---

4 4. Founding ownership & equity structure (LLC units)

Membership interests are **membership units** governed by the **operating agreement** — no stock, no authorized-share count, no Delaware franchise tax to engineer. The Company authorizes **10,000,000 units**, all Class A Voting, split between the two founding members with a reserved incentive pool.

Agreed ownership (as implemented in `docs/legal/OPERATING-AGREEMENT.md` + `INITIAL-RESOLUTIONS.md`):

Member / reserve	Units	Interest	Class / vote
Chad Cromwell — Manager + CEO + Partnership Representative	5,100,000	**51%**	Class A Voting
Oran Cromwell (father/son)	4,000,000	**40%**	Class A Voting
Equity Incentive Plan pool — *reserved, unissued*	900,000	**9%**	per award
Total authorized	10,000,000	100%	

Both founders' units are **fully vested** on the effective date. The 9% pool is reserved (not outstanding, no vote, no allocations) until issued as **profits-interest** awards under the Plan. *(Governance percentages are computed on issued/outstanding units; see the OA §2.2 and `INITIAL-RESOLUTIONS.md`. The father/son ownership is a deliberate design — confirm the estate/gift implications with counsel + CPA. ⚖)*

Item	Recommendation	Why
Ownership	**Chad 51% / Oran 40% / 9% pool**	Clean co-founder split; Chad holds majority control + manages
Units	**10,000,000 units** authorized (5.1M / 4.0M issued; 0.9M reserved)	Clean for future grants + the C-corp conversion
Capital contribution	Each member contributes cash (e.g., $500–1,000); **Chad also contributes the assigned IP**	Establishes basis + the LLC's capital (§704(c) on the contributed IP — ⚖ CPA)
Tax election	Default **partnership** (multi-member); **revisit S-corp election** only if profits get large	Don't over-optimize taxes pre-revenue

Operating agreement — your most important governance document. DO NOW. It defines ownership (the 51/40/9 split), management (**Chad as manager**), capital, unanimous-consent Reserved Matters, transfer restrictions, the two-member **deadlock/buy-sell** backstop, and how **profits interests** get admitted from the pool. Banks and a future conversion both rely on it, and it reinforces the liability shield (an LLC without one is easier to "pierce").

Incentive equity for future hires/advisors — profits interests. When you bring people on, an LLC grants **profits interests** (a share of *future* upside, not existing value) rather than stock options. They're tax-efficient if papered correctly — and the moment they get complex is exactly the moment to do the **Delaware C-corp conversion** (§2.2) and switch to a normal option pool.

The 83(b) nuance for an LLC. ⚖ note. The founders' units are issued **fully vested and outright**, so the classic founder-stock 83(b) urgency doesn't apply to Chad's or Oran's initial units. But 83(b) *does* matter for the pool: every **profits-interest** award (and any later unit subject to vesting) should file a protective **83(b) election within 30 days** of that grant. Keep the 30-day rule on the radar for every Plan award — it's unfixable if missed.

SAFE-ready / raise posture. You can technically raise into an LLC, but most investors want a Delaware C-corp and a SAFE. So the plan is: stay lean as the LLC; **convert to a DE C-corp the moment a real raise is on the table**, then raise on a standard **SAFE** (the YC standard). Don't contort the LLC to look like a startup it isn't yet.

Tooling: a cap-table tool is overkill for a closely-held two-member LLC — the operating agreement's Schedule A plus a folder of signed docs is the cap table now. Adopt **Carta/Pulley** at conversion, when options and investors arrive.

5 5. Governance, founding documents & the IP assignment

Every LLC needs the real paper — skipping it weakens the liability shield and creates problems exactly when you can least afford them (a raise, a partner-bank diligence, an acquisition). With two members it also fixes the split, the manager's authority, and the deadlock/buy-sell rules before they're ever tested.

The document set (DO NOW):

- **Articles of Organization** (filed with Wyoming) — the LLC's name and registered agent (ownership stays off the public filing).
- **Operating Agreement** — the 51/40/9 ownership, **Chad as manager**, capital, Reserved Matters, transfer restrictions, and the rules for admitting profits interests from the pool (§4). The cornerstone document.
- **Initial Member/Manager Resolutions** — issue the founders' units, appoint Chad Manager+CEO, adopt the partnership tax classification, authorize the bank account + the IP contribution (`INITIAL-RESOLUTIONS.md`).
- **EIN** from the IRS (free; needed for the bank account — a multi-member LLC files Form 1065 under its EIN).
- **IP / Invention Assignment** — **Chad** signs one assigning his work to the LLC as a capital contribution; every contributor signs one too (see below).

The IP assignment — do this immediately. ⚖ **DO NOW.** Right now, *you personally* wrote the code sitting in this repository — which means **you**, not the company, may own it. Before any value accrues, execute a **Technology/IP Assignment Agreement** transferring all of it (code, designs, the Goemon Global Finance marks, domains, the architecture docs) to `Goemon Global Finance, LLC`. This is the #1 thing acquirers and investors diligence, it survives the future C-corp conversion intact, and it's trivially cheap to fix today and expensive to fix later. Make sure any contractor or contributor (now or ever) signs an assignment too — work-for-hire alone is not enough for IP.

6 6. The phased compliance roadmap *(the heart of this document)*

Phase A — Launch as non-custodial software (DO NOW)

Goal: deliver real product value while staying outside money-transmitter and broker-dealer scope.

What keeps you out of scope:

- **Non-custodial by architecture.** Keys are generated and held in the user's Secure Enclave; the server never holds a user's private key (a *locked* architecture decision in this repo). You are not holding customer funds, so you are generally not a money transmitter under FinCEN's framework for non-custodial wallet software.
- **Tokenization framed as software.** You build the rails; you are not the issuer of record taking in investor money. The repo's demo securities are explicitly labeled "not a real offering" — keep that posture until an entity is set up to issue properly (Phase B).
- **Partner out everything that touches money.** No fiat on/off-ramp run by you. If users need to buy crypto, route them to a licensed third party (e.g., an embedded on-ramp like MoonPay/Stripe Crypto/Coinbase) under *their* license, not yours.

What you CAN do in Phase A: non-custodial wallet, DID/VC identity, tokenized-asset *viewing* and *peer-to-peer* transfers the user signs themselves, the AI agent/MCP experience operating under user-granted, user-signed authorizations (already built), and a marketplace UI that *links to* but does not *operate* the trade as principal.

What you CANNOT do in Phase A: hold customer USD or crypto, run an exchange/order book as intermediary, issue and sell securities to the public, or move money between users as the middleman.

The securities reality of tokenized RWAs. ⚖ see counsel — this is the sharpest edge. A tokenized building, fund, or business interest is almost certainly a **security**. Selling it in the US requires either registration or an exemption:

Exemption	Who can invest	Raise cap	Marketing	Fit for Goemon Global Finance
Reg D 506(c)	Accredited only (verified)	Unlimited	Public solicitation OK	Best early path; pair with accreditation checks
Reg A+ (Tier 2)	Anyone	$75M/yr	Public	Costly "mini-IPO"; later phase
Reg CF	Anyone	$5M/yr	Via funding portal	Needs a registered portal partner

Your repo already models the compliance gating (tier/jurisdiction/holder-cap, the Compliance Module), which maps cleanly onto Reg D accreditation + holder caps — but the *legal* offering wrapper must be built with a securities attorney before you sell anything real.

Phase A compliance you DO still need (cheap, do it now):

- A written **AML/KYC policy** and a named compliance officer (you), even pre-license — it's table stakes for partner diligence and good hygiene. The repo's identity ladder + VC issuance + append-only audit log are most of the technical substrate.
- **OFAC/sanctions screening** at onboarding (screen every user against SDN lists).
- **Terms of Service, Privacy Policy, E-Sign consent, risk disclosures.**

Phase B — Partnered (DEFER → when you need fiat or pooled custody)

When users need to move real dollars or you need to custody pooled assets, plug in regulated partners rather than becoming regulated yourself:

- **BaaS / partner bank** (e.g., Column, Lead Bank, Unit/Treasury Prime as middleware) — for FBO accounts, ACH, debit, fiat rails. *They* hold the banking license; you ride it.
- **Qualified custodian** for crypto/RWA custody (e.g., Anchorage, BitGo, Fireblocks-backed).
- **Transfer agent** for tokenized securities cap-table-of-record.
- **KYC/AML vendor** (Persona, Alloy, Footprint) to industrialize identity + sanctions + ongoing monitoring.

Trigger: the first time money or pooled custody flows through *you*, you very likely must **register as a FinCEN Money Services Business (MSB)** (a federal registration, ~free, biennial) and your written AML program becomes mandatory, not optional. ⚖️ see counsel on the exact trigger.

Phase C — Licensed (DEFER → when scale justifies owning the rails)

The expensive, defensible end state, pursued only when unit economics justify it:

- **State Money Transmitter Licenses (MTLs)** — the big one. ~$50–150k+ to get a meaningful US footprint, surety bonds per state, minimum net worth, multi-year timeline. Most fintechs **partner instead** (Phase B) for years; only bring MTLs in-house when margin demands it.
- **Broker-dealer / ATS** — if you want to operate secondary trading of tokenized securities as principal/venue, you need a registered broker-dealer and likely an **ATS** (Alternative Trading System). Realistically a partnership (e.g., with a licensed BD/ATS) long before you own one.
- **Transfer-agent registration** — SEC Form TA-1 if you become the official record-keeper for securities holders.
- **Wyoming SPDI charter** — the long-horizon "crypto bank" option for custody at scale.

---

7 7. Corporate bank account & money movement

DO NOW: open a corporate account at a **fintech-friendly bank** once you have the EIN + formation docs:

- **Mercury** — the startup default; good API, treasury, crypto-tolerant. Strong first choice.
- **Brex** — cards + spend management; good if you want corporate cards early.
- **Column / regional banks** — relevant later as actual banking *partners* (Phase B), distinct from your operating account.

What they'll ask for: EIN, Articles of Organization + operating agreement, your ID, beneficial-ownership info, and a description of the business. **Be precise and honest** that you're building crypto/tokenization software — vague or evasive answers get accounts frozen ("de-risked"). A clean "non-custodial software, no customer funds in Phase A" story is bankable; "we move customer crypto" without licenses is not.

The commingling rule (non-negotiable): the moment any customer-adjacent funds exist, they live in **separate FBO/escrow accounts**, never your operating account. Commingling customer money with corporate money is how fintechs get shut down and founders get personal liability. In Phase A you avoid this entirely by not holding customer funds.

---

8 8. KYC/AML & BSA program (even before you're licensed)

Build the program early — it's cheap as policy, expensive as a retrofit, and every partner bank will demand to see it.

Element	What it is	Repo substrate that maps to it
Written AML/BSA policy	Your documented program	— (author it; ~$2–5k with counsel or a template)
Designated compliance officer	A named human (you, initially)	—
CIP / KYC	Verify identity at onboarding	Tiered identity ladder, DID/VC issuance, risk-adaptive onboarding
Sanctions/OFAC screening	Screen against SDN/blocklists	Onboarding signal scoring hook
Transaction monitoring	Flag suspicious patterns	The ledger + orchestration engine (basis for the fraud system in the tech plan)
SAR/CTR readiness	File Suspicious Activity / Currency Transaction Reports when required	Append-only `audit_logs` / `mcp_audit_logs` give the immutable trail
Recordkeeping	Retain records 5 yrs	Append-only ledger + audit logs

The point: your existing technical primitives (append-only audit, identity ladder, VC, signal scoring) are already ~70% of a credible AML program's *evidence layer*. What's missing is the **written policy + named officer + screening vendor**, which is mostly paperwork and a tool.

9 9. What you're missing — the founder checklist

#	Item	Priority	Notes
1	**EIN**	DO NOW	Free from IRS; gates the bank account
2	**Registered agent** in Wyoming	DO NOW	~$50–125/yr (Wyoming Agents, Northwest, etc.)
3	**Foreign qualification** in your home state	DO NOW	Where you actually operate; confirm if a high-fee state requires LLC registration too
4	⚠ **"Bank" naming risk**	DO NOW	"Bank"/"banking" are **regulated terms**; using them without a charter invites cease-and-desist. Consider a market-facing brand that avoids implying you *are* a bank ("Goemon Global Finance" the company is fine; marketing copy saying "your bank" is not). ⚖ see counsel
5	**Trademark** the brand	Soon	USPTO search + file; the name/marks should be company-owned (via §5 IP assignment)
6	**Terms of Service / Privacy Policy / E-Sign / risk disclosures**	DO NOW	Before any user signs up
7	**Data protection: GLBA + state privacy (CCPA/CPRA etc.)**	DO NOW	Fintech data is sensitive; GLBA safeguards apply once you're financial
8	**Cyber + tech E&O insurance**	Phase B	Partners will require it; also basic prudence
9	**Cap-table tool** (Carta/Pulley)	At conversion	Overkill for a closely-held two-member LLC (Schedule A is the cap table); adopt when options/investors arrive
10	**Accounting + R&D tax credits**	Soon	A startup CPA; the federal R&D credit can offset payroll tax — real money for a dev-heavy build
11	**Beneficial Ownership (BOI)** reporting	Check status	FinCEN BOI rules have shifted; confirm current applicability ⚖

#	Item	Priority	Notes
12	**Business insurance / D&O**	Phase B	Especially before taking on any investor
13	**"Not advice" disclaimers** in-product	DO NOW	Especially around tokenized-asset/investment surfaces

10 10. 90-day action checklist (ordered)

Days 1–14 — exist as a company

1. Pick the exact legal name; clear it (Wyoming name check + USPTO knockout search).
2. File the **Wyoming LLC** (Articles of Organization); appoint a registered agent.
3. Get the **EIN**.
4. Adopt the **operating agreement** (Chad as manager; Chad 51% / Oran 40% / 9% pool) and the **initial resolutions**; each member makes their **capital contribution**.
5. Execute the **IP/Technology Assignment** (repo → `Goemon Global Finance, LLC`); Chad contributes the IP and every contributor signs an invention assignment.
6. *(The founders' units are issued fully vested, so no founder 83(b) is triggered. But file a protective **83(b)** within 30 days of any **profits-interest** grant from the 9% pool — unfixable if missed.)*

Days 15–45 — be operational & bankable 7. Open the **Mercury** (or Brex) business account. 8. Foreign-qualify in your home state. 9. Engage a **startup CPA** and (for the regulated questions) a **fintech/securities attorney** — even a few scoped hours now prevents expensive mistakes.

Days 46–90 — compliance & launch posture 11. Draft **ToS / Privacy / E-Sign / risk disclosures**; publish before onboarding users. 12. Write the **AML/KYC policy**; name yourself compliance officer; wire in **OFAC screening**. 13. Lock the **Phase-A product scope** to non-custodial / no-customer-funds; document *why* each feature stays in scope (this doc + counsel sign-off is your defense). 14. File the **trademark**; finalize the market-facing brand that avoids the "bank" trap. 15. Decide the **Phase-B trigger** in writing (what user need forces partners + MSB registration) so you advance deliberately, not by accident.

Appendix — rough first-year cost envelope (bootstrap)

Line	Estimate
Wyoming LLC formation (DIY–assisted)	$100–500
Registered agent	$50–125/yr
Wyoming annual report / license tax	~$60–100/yr
Home-state foreign qualification	$100–400
Operating agreement (template + review)	$0–1.5k
Legal (scoped: formation review, IP, AML policy, securities Q&A)	$3–10k
Startup CPA (setup + first year)	$1–3k
ToS/Privacy (templated + reviewed)	$0.5–3k
Total realistic Year-1	**~$5–18k** (LLC keeps the floor lower than a C-corp)

Compare that to Phase-C licensing ($50–150k+ for MTLs alone) and the logic of the lean ramp is obvious: **spend thousands to launch, defer the hundreds-of-thousands until revenue earns it.**

Operative legal set: `docs/legal/` *—* `OPERATING-AGREEMENT.md` *(cornerstone),* `INITIAL-RESOLUTIONS.md`*,* `EQUITY-INCENTIVE-PLAN.md`*, and* `FORMATION-articles-of-organization.md`*. These implement the* ***two-member Chad 51% / Oran 40% / 9% pool*** *design described above and are the authoritative record of ownership, management, and the pool.*

Superseded alternative: `GO-LIVE-PLAN.md` *proposed a different ownership design — an anonymous, child-owned Wyoming IP HoldCo plus a separate founder-owned management company.* ***That design was not adopted*** *(the two-member LLC above was), and* `GO-LIVE-PLAN.md` *is retained only for its reasoning + guerrilla-marketing plan.*

Next document: the Production Deployment & Technology Strategy — cloud, the agent/MCP/skills automation fabric, the Neo4j Identity Vault, the fraud system on your orchestration engine, Constellation digital evidence, iOS-vs-Android, and GTM.
