

B

Tokenization Master Plan

Goemon Global Finance — one engine, many verticals (P1–P6 + verticals built)

GOEMON GLOBAL FINANCE · CONFIDENTIAL — FOUNDER · JULY 3, 2026

Strategic guidance only — not legal, financial, tax, or investment advice.
Securities, money-transmission, and corporate-formation decisions must be reviewed by licensed counsel and a CPA before you act. Sections flagged “see counsel” are where this matters most.

Contents

6. 4. Prioritization & sequencing
7. 5. Compliance ramp (A→B→C) mapping
8. 6. Keep it simple first — the one engineering step that unlocks the rest

Goemon — Tokenization Master Plan

One engine, many verticals. The future architecture for Goemon as a universal, compliant, non-custodial tokenization platform for the entire industry — *without* displacing the MVP.

Keep it simple first. The MVP ships as-is (collectibles). Nothing here changes that. This is the future map: the top 15 focus areas — platform capabilities **and** asset-class verticals — most of which reuse the engine Goemon **already has**. Strategy, not legal advice; every regulated step is ∞ counsel-gated. Companion: `docs/PHASE-28-RWA-EXPANSION.md` , `docs/business/RWA-NEOBANK-COMPETITIVE-REVIEW.md` , `docs/business/CORPORATE-STRUCTURE.md` (A→B→C ramp).

1 1. The thesis — don't build 15 products; build ONE platform + N profiles

Goemon's tokenization engine is **already asset-agnostic**. That is the whole game: the cost of a new asset class is a *profile*, not a *rewrite*. Concretely, these primitives are kind-agnostic today:

Primitive	What it does	File
Asset = ledger currency code	Every asset is <code>ASSET:<id></code> ; supply/holdings tracked as a distinct currency so the ledger balances money and units atomically	<code>services/ledgerService.ts</code> , <code>services/tokenizationService.ts</code> (AssetKind, <code>createAsset</code>)
Compliance Module	<code>checkTransfer</code> : identity registry + min-tier (all kinds) + jurisdiction allow-list + holder-cap (auto-applied only when the asset <code>isSecurity</code>)	<code>services/complianceService.ts:32-64</code>
Primary issuance (escrow)	<code>subscribe</code> → <code>close/refund</code> : cash into escrow, one atomic journal delivers units from treasury + releases to issuer + collects fee	<code>services/marketplaceService.ts</code>
Secondary trading	<code>placeOrder</code> buy/sell as one atomic cash+asset+fee journal (compliance-gated on the buyer)	<code>services/marketplaceService.ts</code>
Transfer	P2P asset move; securities route through compliance, others check tier only	<code>services/marketplaceService.ts</code>
Corporate actions	<code>distributeDividend</code> / <code>declareCorporateAction</code> : pro-rata by on-chain balance, one idempotent journal per holder; splits	<code>services/corporateActionService.ts</code>
Redemption	<code>redeem</code> : burn units → deliver proceeds, one atomic journal; swappable issuer seam	<code>services/redemptionService.ts</code>
Listings + pricing	Versioned insert-only lifecycle (staging→soft→public→paused→delisted); price source + staleness	<code>services/listingService.ts</code> , <code>services/pricingService.ts</code>
Kill-switch pattern	<code><VERTICAL>_ENABLED</code> + <code><VERTICAL>_PROVIDER</code> + prod-fatal guard	<code>config.ts</code> , <code>productionFatalts()</code>

So adding a vertical = new `AssetKind` value + a compliance profile + domain metadata + an optional issuer seam + a config flag. The moat is this engine's four properties, which no single-asset competitor combines: **non-custodial** • **compliance-as-code** • **agent-native** • **ledger⇌chain reconciled**.

The strategic consequence: the highest-leverage thing to build after the MVP is **not** any one vertical — it's the **platform layer (P1–P3, P6)** that turns every future asset class into "onboard a profile." Build the engine once; the 9 verticals become configuration.

2 2. What you already have / already planned (so "new" is clear)

- **LIVE (MVP):** `collectible` + `gaming` (HTS, tier-only, free transfer).
- **Prototype (ERC-3643, `*_ENABLED` prod-fatal):** `security`, `equity` (Phase 18.6, Dinari-style 1:1 equities), `treasury` (Ondo-style yield).
- **Planned — Phase 28 RWA Expansion:** tokenized-treasury yield, private credit, real estate, funds/ indices, issuance-as-a-service. (Real estate = the Lofty/RealT lane you already named.)

The 15 below go beyond these — the land/farmland/commodities/SMB/royalties/receivables verticals and the platform capabilities (issuance console, compliance-as-a-service, management tools, employee equity, capital formation, secondary/ATS) you flagged.

3 3. The Top 15 — mini business-case each

Format per item: what · why/underserved · model to follow · Goemon reuse · compliance gate · ramp.

Part A — Platform capabilities (what makes it "one-size-fits-all")

STATUS — Part A is BUILT (P1–P6, prototype seams, each behind a prod-fatal kill-switch). The engine layer from §6 is real: an issuer can create a compliant token, raise capital on it, grant equity to employees, and holders can trade it on a secondary book and track everything — all on the one asset-agnostic engine.

- **P1** issuance console — `issuanceService` + `assetTypeRegistry` + `complianceProfiles`; routes `/api/issuer/*`; UI `/issuer`.
(`ISSUANCE_CONSOLE_ENABLED`)
- **P2** compliance-as-a-service — `complianceProfiles` (composable dimensions incl. real **accreditation**, whitelist, lockup); admin `/api/admin/identities/:id/accreditation`.
- **P3** holder cockpit — `portfolioService` (positions/distributions/tax summary); routes `/api/portfolio/*`; UI `/portfolio`.
- **P4** employee equity comp — `equityCompService` (grants, cliff+linear vesting, 83(b), option exercise, cap table); `/api/equity/*`; UI `/equity`. (`EQUITY_COMP_ENABLED`)
Ties to `docs/legal/EQUITY-INCENTIVE-PLAN.md`.
- **P5** capital formation — `capitalRaiseService` (offerings, escrowed commitments, settle/refund at target, Reg CF/D/A + accreditation gate); `/api/raise/*`; UI `/raise`.
(`CAPITAL_RAISE_ENABLED`)
- **P6** secondary market — `secondaryMarketService` (peer-to-peer limit order book + matching engine, escrow, compliance-checked fills); `/api/market/*`; UI `/exchange`.
(`SECONDARY_MARKET_ENABLED`)

Onboarded verticals (proof of §6 — each is a registry entry + metadata, ZERO engine changes):

- **Real estate** — land / farmland / apartments (ERC-3643 security; rent distributes). `npm run seed:realestate`
- **Commodities** — gold / silver / energy / timber (HTS, exempt/freely-tradeable; proof-of-reserve metadata). `npm run seed:verticals`
- **IP royalties** — music / film / patent / publishing (ERC-3643 security; royalty stream distributes pro-rata via corporate actions). `npm run seed:verticals`

All three appear automatically in the P1 issuance console type picker and the marketplace, and flow through P5 raises, P6 secondary trading, and (for income assets) P3 distributions — with no new engine code. A new vertical is "onboard a profile," not a project.

P1 — Self-serve compliant issuance console ("tokenize anything").

- *What:* a guided console where any issuer creates a compliant token in minutes — pick asset kind, jurisdiction rules, holder cap, transfer restrictions, docs, price source; mint to treasury; list.

- *Why*: this is the product that converts the other 14 into "onboard a profile," and it's the industry's real bottleneck (issuance is slow, bespoke, lawyer-heavy).
- *Model*: Tokeny / Securitize self-serve issuance.
- *Reuse*: `tokenizationService.createAsset` + `listingService` lifecycle + Compliance Module — already the whole flow; needs a UI/console + a **compliance-profile registry** (see P2).
- *Gate*: the console is Phase-A software; what the issuer *sells* carries its own gate.
- *Ramp*: **A** (build) → per-asset **B/C**.

P2 — Compliance-as-a-service (programmable transfer rules).

- *What*: extend the Compliance Module beyond tier/jurisdiction/holder-cap to a library of **reusable per-asset compliance profiles**: accreditation checks, **lockups (Reg D 1-yr)**, max-investor (\$12(g)), whitelists, sanctions/OFAC, transfer windows, tax-lot rules — driven by **ONCHAINID** / **W3C VC** identity.
- *Why*: the regulatory logic is the moat; make it declarative and every vertical inherits it.
- *Model*: ERC-3643 T-REX + ONCHAINID (already in the PRD).
- *Reuse*: `complianceService.checkTransfer` is the exact seam — add dimensions + a profile record on the asset.
- *Gate*: **A** (software); ⚖ counsel defines each profile.
- *Ramp*: **A**.

P3 — Investment-management tools (the holder cockpit).

- *What*: the "tools to manage your tokens" you asked for — portfolio dashboard, NAV/valuation, distributions history, **tax documents (1099-DIV / 1099-B / K-1)**, performance, statements, DRIP/rebalancing, corporate-action notices.
- *Why*: holders won't hold what they can't track/report; this is table stakes for real money and a retention/AUM lever.
- *Model*: Carta (cap-table/portfolio) + brokerage statements.
- *Reuse*: `corporateActionService` (distributions) + ledger projections + `pricingService` — the data exists; this is a reporting/UX layer.
- *Gate*: **A** (software); tax-doc generation ⚖ CPA.
- *Ramp*: **A**.

P4 — Employee participation / equity compensation.

- *What*: tokenized **equity / options / profits-interests as compensation**, with on-chain vesting, a live cap table, 83(b) tracking, and exercise — for Goemon's own team and as a product for other companies.

- *Why*: underserved and Goemon has a **head start** — the `docs/legal/EQUITY-INCENTIVE-PLAN.md` already models units/options/profits-interests + vesting + 83(b); the ledger + compliance enforce it.
- *Model*: Carta + on-chain vesting; ties to P5 (capital formation) and Phase 25 (SMB).
- *Reuse*: `equity` AssetKind + Compliance Module (transfer restrictions/lockups) + corporate actions (for distributions) + the Equity Incentive Plan legal spine.
- *Gate*: private-company securities (Rule 701 / Reg D), 409A valuation ⚡.
- *Ramp*: A/B.

P5 — Capital formation / corporate financing (primary-raise rails).

- *What*: a business raises capital by issuing tokenized **equity / debt / revenue-share** under **Reg CF / D 506(c) / A+** — accreditation checks, escrow-close, cap table, investor comms.
- *Why*: your "corporate/scalable financing" ask; the primary-market on-ramp for most of Part B.
- *Model*: Republic / StartEngine (Reg CF) + Securitize (Reg D).
- *Reuse*: escrow `subscribe → close/refund` is a compliant primary raise; add accreditation (P2) + funding-portal/BD partner.
- *Gate*: B/C — funding portal (CF) or BD (D/A+); ⚡.
- *Ramp*: B → C.

P6 — Secondary liquidity — ATS + AMM (the liquidity unlock).

- *What*: the trading venue that makes any tokenized asset *actually sellable* — a regulated **ATS** for securities, and bonding-curve/orderbook AMM for exempt assets (collectibles/commodities).
- *Why*: **illiquidity is the #1 reason RWA tokens die**. Solving it turns "fractional" into "fractional *and* liquid" — the "accessible investment" you asked for.
- *Model*: tZERO / Securitize Markets (ATS); AMM for exempt assets.
- *Reuse*: `marketplaceService.placeOrder` is the secondary engine — route it to a real venue/partner.
- *Gate*: C — broker-dealer + ATS registration (partner first).
- *Ramp*: C (cross-cutting; unlocks every vertical).

Part B — Asset-class verticals (what to tokenize, beyond the current plan)

V1 — Land (raw / undeveloped / entitled). (You asked: "what about land?")

- *What:* raw parcels, land banking, entitled lots, development rights — distinct from Lofty's built housing. *Why:* huge, illiquid, underserved; simple title story vs operating property. *Model:* LLC-per-parcel + Reg D. *Reuse:* `security` profile + attestation metadata (deed/survey/title). *Gate:* Reg D/S, per-parcel LLC $\varnothing$. *Ramp:* **B**→**C**.

V2 — Farmland & agriculture. (You asked: "agriculture.")

- *What:* farmland (AcreTrader model), crop/harvest **revenue-share**, livestock, **ag receivables**, **water rights**. *Why:* large, income-producing, inflation-hedge, underserved by crypto. *Model:* AcreTrader / FarmTogether. *Reuse:* security profile + corporate actions (harvest/rent distributions). *Gate:* Reg D + ag/land counsel $\varnothing$. *Ramp:* **B**→**C**.

V3 — Commodities & precious metals. (You asked: "commodities.")

- *What:* gold/silver (1:1 vaulted), energy, **timber**, industrial metals. *Why:* proven demand; clean 1:1-backing story. *Model:* PAXG (gold) / vaulted-metal tokens. *Reuse:* `commodity` AssetKind
 - **proof-of-reserve / custody attestation** (`custodyAttestationUri`) + reconciliation. *Gate:* custodian + assayer; commodity/MSB posture $\varnothing$. *Ramp:* **B**.

V4 — Carbon & environmental / renewable-energy revenue.

- *What:* carbon credits, solar/wind **project revenue-share**, RECs. *Why:* ESG demand + real yield; registry rails maturing. *Model:* Toucan / KlimaDAO (carbon) + project-revenue tokens. *Reuse:* security/commodity profile + oracle/registry integration + corporate actions (revenue). *Gate:* registry integration, double-count controls $\varnothing$. *Ramp:* **B**.

V5 — Small business — equity + revenue-based financing. (You asked: "small business.")

- *What:* tokenize SMB ownership or **revenue-share** notes for Main-Street businesses; local/community investing. *Why:* enormous underserved capital gap; complements Phase 25 (SMB banking). *Model:* Honeycomb / Mainvest (Reg CF revenue-share). *Reuse:* escrow issuance (P5) + Compliance Module + corporate actions (revenue payouts). *Gate:* Reg CF portal / Reg D $\varnothing$. *Ramp:* **B**.

V6 — IP & royalties.

- *What:* music, film, patents, publishing, brand-licensing — **recurring royalty streams**. *Why:* creator-economy demand; predictable cash flows map perfectly to pro-rata distribution. *Model:* Royal (music) / IP-royalty marketplaces. *Reuse:* security profile + `corporateActionService` (royalty distributions are just dividends by another name). *Gate:* Reg D/A+, IP/royalty admin $\varnothing$. *Ramp:* **B**→**C**.

V7 — Invoices / trade receivables / supply-chain finance.

- *What*: tokenized **receivables** + working-capital pools. *Why*: B2B, high-velocity, real yield, proven on-chain. *Model*: Centrifuge (receivables/private credit). *Reuse*: security/debt profile + redemption (maturity payout) + corporate actions (coupons). *Gate*: Reg D, underwriting/servicer partner $\varnothing$. *Ramp*: **B**→**C**.

V8 — Luxury & alternative collectibles (MVP-adjacent extension).

- *What*: art, watches, wine/whisky, rare cars, sneakers, memorabilia — fractional. *Why*: the **closest expansion to the collectibles MVP** — same HTS rail, tier-only gating, no securities overhead (until fractional-as-security). *Model*: Masterworks (art) / Rally. *Reuse*: the LIVE `collectible` path + escrow (`COLLECTIBLES_ESCROW_ENABLED`) + provenance metadata. *Gate*: A for whole-item; **fractional may be a security** $\varnothing$. *Ramp*: **A** → **B** (fractional).

V9 — Vehicles, equipment & machinery.

- *What*: asset-backed **leasing** — fleets, aircraft/marine fractional, equipment finance; yield from lease income. *Why*: tangible collateral + recurring lease yield. *Model*: equipment-finance / fractional-jet platforms. *Reuse*: security profile + attestation + corporate actions (lease distributions). *Gate*: Reg D, servicer/lessor partner $\varnothing$. *Ramp*: **B**→**C**.

Frontier bin (noted, not in the 15): fund-LP secondaries, sports/creator income-share, muni / SME / consumer debt, insurance / parametric risk pools — revisit once the platform + first verticals prove out.

4 4. Prioritization & sequencing

Scored by **reuse-ease** (how much of the engine is already there), **market** (size/underserved), **compliance gate** (A cheap → C expensive), and **MVP-adjacency**.

Wave	Items	Rationale
0 — MVP	Collectibles (LIVE)	Ship as-is. No change.
1 — Engine	P1 issuance console · P2 compliance-as-a-service · P3 mgmt tools	Highest leverage: turns every later vertical into "onboard a profile." Mostly Phase-A software on existing primitives.
2 — MVP-adjacent	V8 luxury/alt collectibles	Same HTS rail, tier-only; fastest new revenue after the MVP.
3 — Real assets	V1 land · V2 farmland · V3 commodities · V4 carbon	Security profile + attestation/proof-of-reserve; issuer/custodian partners (B).
4 — Capital formation	V5 SMB · P5 corporate financing · P4 employee equity	The primary-raise cluster; leverages escrow issuance + the Equity Incentive Plan.
5 — Income streams	V6 royalties · V7 receivables	Pure fit for the corporate-actions engine (recurring pro-rata).
Cross-cutting	P6 secondary/ATS	Pursue in parallel once volume justifies the BD/ATS partner — it unlocks liquidity for all verticals.

5 5. Compliance ramp (A→B→C) mapping

- **A — non-custodial software:** the platform layer (P1–P3), whole-item collectibles (V8), and every vertical's *software* (issuance/compliance/mgmt) with no customer-fund custody.
- **B — partnered:** issuer / custodian / transfer-agent / funding-portal + FinCEN MSB — unlocks the security verticals (V1–V7, V9), capital formation (P5), employee equity (P4).
- **C — licensed:** broker-dealer / **ATS** / transfer-agent registration — unlocks secondary liquidity (P6) and self-operated primary/secondary securities markets.

Consistent with [docs/business/CORPORATE-STRUCTURE.md](#). The rule holds throughout: **distribute and operate the rails; partner the regulated issuer/venue — don't become the issuer of record until scale justifies it.**

6 6. Keep it simple first — the one engineering step that unlocks the rest

None of this displaces the collectibles MVP. When you're ready to build beyond it, the single highest-leverage move is **not** a vertical — it's:

Generalize `AssetKind` into a data-driven asset-type registry + a compliance-profile registry, and build the P1 issuance console on top.

After that step, each of V1–V9 is a **profile + metadata + (optional) issuer seam + a config flag** — days, not projects — exactly the pattern already used for `equity` / `treasury` (`*_ENABLED` + `*_PROVIDER` + prod-fatal). That is how "one-size-fits-all for the entire industry" becomes real without building fifteen separate products.

Roadmap home: Phase 29 (`docs/GOEMON-PLAN.md`) — Tokenization Platform, the umbrella over the Phase-28 RWA menu. This document is the detailed design; the phase entry is the pointer.
